Sponsored by

Consistent weld quality is critical in life-critical industries such as medical devices, aerospace, and automotive. Traditionally, quality assurance relied on pre/post weld checks and destructive testing, including pull testing and cross-sectioning.

This webinar explores advanced laser process monitors that capture real-time signals — including melt pool behavior and plasma emissions — to detect weld defects, parameter deviations, and equipment issues early. Attendees will learn about the types of monitoring systems available, the defects they can identify, and the benefits of implementing them in manufacturing and production environments.

Join Mark Boyle, Ph.D., from AMADA WELD TECH, as he shares insights on applying advanced laser process monitoring to ensure consistent weld quality. With a background in laser-matter interaction and extensive experience in laser welding, micro-TIG, reflow soldering, and laser micromachining, Dr. Boyle brings practical expertise to improve manufacturing outcomes in medical, aerospace, and automotive industries.
